

ABSTRACT AMENDMENT(S)

Please amend the abstract of the application:

Disclosed is an anti-misinsertion mechanism for a card connector defining a correct card connector thickness, the mechanism ~~comprising~~ including: a body; a first link generally extending along the body, the first link including an actuator for actuating the first link to be rotated from a normal position toward an operating position upon detecting existence of the correct thickness of a partially-inserted card; and a second link provided with a stopper for selectively preventing full insertion of the card, the second link being pivoted to the body and operatively connected to the first link, thereby being rotatable between a normal position and an operating position relative to the normal and operating positions of the first link.
